Solutions for New Technologies

# Highly Flexible Couplings for Cardan Shafts

## Periflex® CS Couplings

Highly flexible rubber couplings with linear characteristic for connecting a cardan shaft directly to a diesel engine. The ring element can be bolted directly to the flywheel. The cardan shaft is flange-mounted to the B-side of the coupling. Deflection angle of the cardan shaft of up to 5°. The radial and axial forces generated by the cardan shaft are absorbed by an internal plain bearing and transmitted to the engine bearing.

Torque range between 560 Nm to 14,800 Nm.

## Stromag IGE...FG

Highly flexible rubber coupling with a progressive characteristic for connecting a cardan shaft directly to a diesel engine. For the transmission of high torques with its compact design and light weight. The coupling is flange-mounted to the B-side of the coupling. The cardan shaft is flange-mounted to the B-side of the coupling. Deflection angle of the cardan shaft of up to 5°. The radial and axial forces generated by the cardan shaft are absorbed by an internal plain bearing and transmitted to the engine bearing.

Torque range between 4000 Nm to 25,000 Nm.

## AFL / PVN flange bearing

Flange bearing as a bell that is mounted to the diesel engine. Inside the bell, an axial mountable Stromag PVN disc coupling is used to transfer the torque from the flywheel to the cardan shaft. The flexible element has a linear characteristic. The integrated bell bearing transfers the reaction forces from the cardan shaft to the engine housing. Deflection angle of the cardan shaft of up to 10°.

Torque range between 1000 Nm to 20,000 Nm.

# Highly Flexible Couplings for Cardan Shafts

---

## The cardan shaft coupling concept

The Stromag product range provides a wide range of cardan shaft couplings. The couplings are designed for use in piston machines for direct connection to a cardan shaft.

The A-side of the coupling can be bolted directly to an engine's flywheel. The cardan shaft is flange-mounted to the B-side of the coupling.

The Stromag cardan shaft coupling is comprised of the combination of an element made from flexible rubber material with a bearing for the secure absorption of the reaction forces applied by a connected cardan shaft.

Three different series of the cardan shaft couplings have been developed in order to satisfy the different requirements in relation to the system torque, torsional stiffness and reaction force.

The highly flexible Stromag Periflex® CS series designs are preferred for standard applications.

The IGE series from the established highly flexible Stromag GE coupling product family is used for applications with high impact loads.

The Stromag flange bearing (AFL) assembly with a disc coupling as a cardan shaft coupling is recommended for an angle of deflection greater than 5°.

## Instructions for the designer

The couplings can be used in a temperature range of between -50°C and +80°C. A specially developed synthetic rubber can be used for the AFL's disc tyre so that this can be used up to a temperature of 120°C.

The flexible elements may heat up as a result of damping work and reach higher temperatures than the ambient temperature. If the coupling is housed in a protective hood or cover, this must be taken into account, or adequate ventilation and heat dissipation must be ensured.

Stromag cardan shaft couplings are available with EN 10204 approval in accordance with the classification society requirements.

Stromag cardan shaft couplings are available with a fail-safe device. A rupture in the flexible element causes claws to intermesh, forming a torsionally rigid, backlash connection between the drive and output sides. Temporary emergency operation is possible with limited torque.

## Instructions on choosing the coupling size

Static and dynamic characteristic values are available for the Stromag cardan shaft couplings. These values can help in the choice of a coupling size which is suitable for the specific application. The key factors for this are the loads arising from the power transmitted and torsional vibrations. Stationary operating modes must be based on  $T_{KN}$ ,  $T_{KW}$  and  $P_{KV}$ , while  $T_{Kmax}$  values are to be used for non-stationary operating modes.

Stromag's specialist departments can provide support with design, particularly in calculating the torsional vibrations. We therefore ask you to complete and send us the question sheet at the end of this catalog.

As a rule, flexible couplings represent the predetermined mechanical breaking point of a drive train. Overloading a drive train therefore generally leads to failure of the flexible coupling element.

This characteristic is intentional and protects the entire system from unexpected damage. Any consequential damage that could arise from the failure of the coupling must be taken into consideration in advance by the system designer and monitored or prevented through appropriate measures.

# Highly Flexible Couplings for Cardan Shafts

## Storage of flexible rubber elements

When stored appropriately, flexible rubber elements retain their properties over several years without any alterations.

It is essential that the stored parts are protected against oxygen, ozone, light, heat, moisture and solvents.

The storage temperature should not fall below +10°C and not exceed +25°C. All UV light sources are harmful and must be avoided. Equipment that generates ozone, e.g. light sources and electric motors, must be kept away from the storage location.

The relative air humidity should not exceed 65%.

Solvents, fuels, lubricants, chemicals, acids, disinfectants may not be kept in the same storage area.

Further details can be taken from DIN 7716 und ISO 2230.

## Periflex® CS Series

### Das Periflex® CS Concept

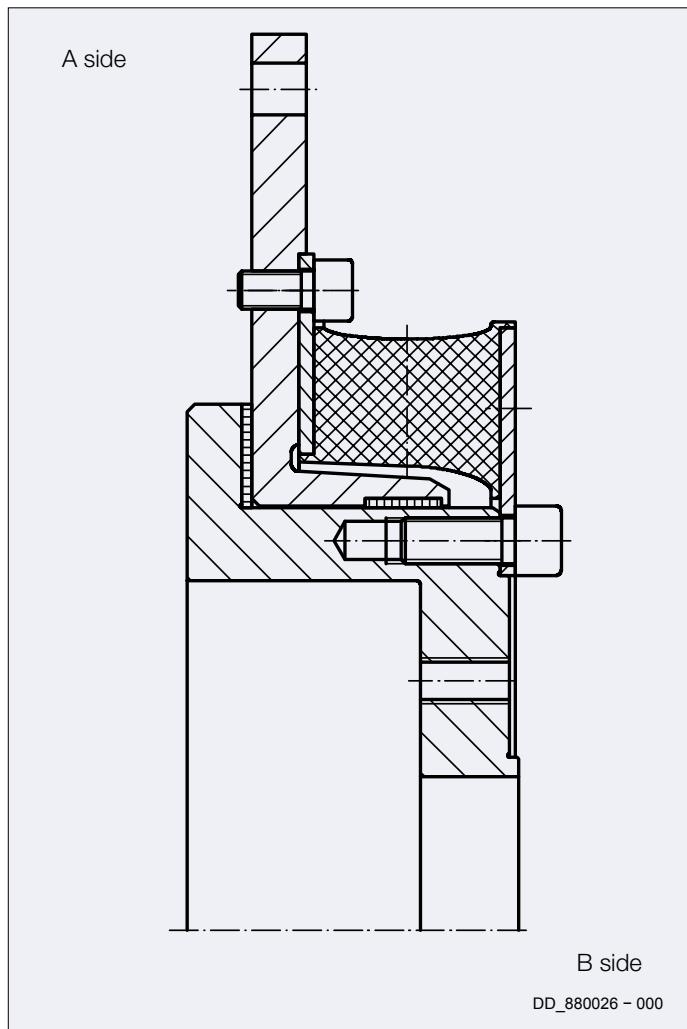

The Periflex® CS couplings are highly flexible rubber couplings with a linear spring characteristic for connecting a cardan shaft directly to a diesel engine drive. The ring element can be bolted directly to an engine's flywheel. The cardan shaft is flange-mounted to the B-side of the coupling. An deflection angle of the cardan shaft of up to 5° is generally permitted, larger angles are available on request.

The series covers the torque range from 560 to 14,800 Nm.

The connecting dimensions on the engine side primarily conform to SAE standard J620 or DIN 6281. The cardan shaft side is available in a range of metric sizes, including for Spicer, Mechanics or cross-toothed connections.

The Periflex® CS coupling is comprised of the combination of a ring element made from flexible rubber material with a bearing for the secure absorption of the reaction forces applied by a connected cardan shaft. The ring element is exclusively torsionally flexible. The bearing consists of an axial and radial plain bearing made from wear-free and maintenance-free composite material.

The metal parts of the Periflex® CS coupling are made from high-quality cast as standard. The ring element is manufactured from natural rubber (NR) in various rubber qualities and torsional stiffnesses. These allow precise adjustment to drives that are susceptible to torsional vibrations.

- 1) For periodic, short-term vibrations during start-stop, switching, etc.
- 2) For rare peak loads, e.g. generator short-circuit
- 3) For:  $T_w = 0.2 \cdot T_{KN}$ ;  $T = 0.8 \cdot T_{KN}$ ;  $f = 10 \text{ Hz}$ ;  $\vartheta = 30^\circ\text{C}$
- 4) Material-related tolerances as high as  $\pm 15\%$  are possible.
- 5) The  $P_{KV 60}$  value describes the damping performance that can be absorbed over 60 minutes.  
Permanently absorbable damping performance  $P_{KV \infty} = 0.5 \cdot P_{KV 60}$

# Highly Flexible Couplings for Cardan Shafts

## Stromag AFL / PVN Series

DD\_881003 - 000

The flange bearing is a bell that is mounted to the diesel engine. An axially mountable, plug-in, highly flexible Stromag Periflex® disc tyre arranged inside the bell transmits the torque from the flywheel to the cardan shaft.

The disc tyre has a linear spring characteristic and ensures the balanced torsional vibration behavior of the system, while the integrated bearing transmits the cardan shaft's reaction forces to the engine housing via the bell. This means that the crank shaft bearings are not exposed to the reaction forces. As a rule, the AFL can be used up to a deflection angle of 10°, larger deflection angles are possible on request, depending on the operating conditions.

The torque transferred by the series is determined by the Stromag Periflex® disc tyre used. The torque range extends from 1000 Nm to 20,000 Nm.

The bell's connecting dimensions to the engine housing are based on SAE standard J617. The connecting dimensions to the flywheel on the engine side primarily conform to SAE standard J620 or DIN 6281.

The cardan shaft side is available in a range of metric sizes, including for Spicer, Mechanics or cross-toothed connections on request.

The flange bearing's bell and the connection ring are manufactured from high-quality cast aluminum, while the other metal parts are steel.

The Stromag Periflex® disc tyre is manufactured from natural rubber (NR) or a synthetic rubber in various torsion spring stiffnesses. These allow an adjustment to drives that are susceptible to torsional vibrations.

1) The values listed in the tables refer to the characteristic values of the disc tyre.

2) For:  $T_w = 0,2 \cdot T_{KN}$ ;  $T = 0,8 \cdot T_{KN}$ ;  $f = 10$  Hz;  $\vartheta = 30^\circ\text{C}$

3) When coupling temperatures are higher than  $30^\circ\text{C}$ , this value must be reduced by the temperature factor.

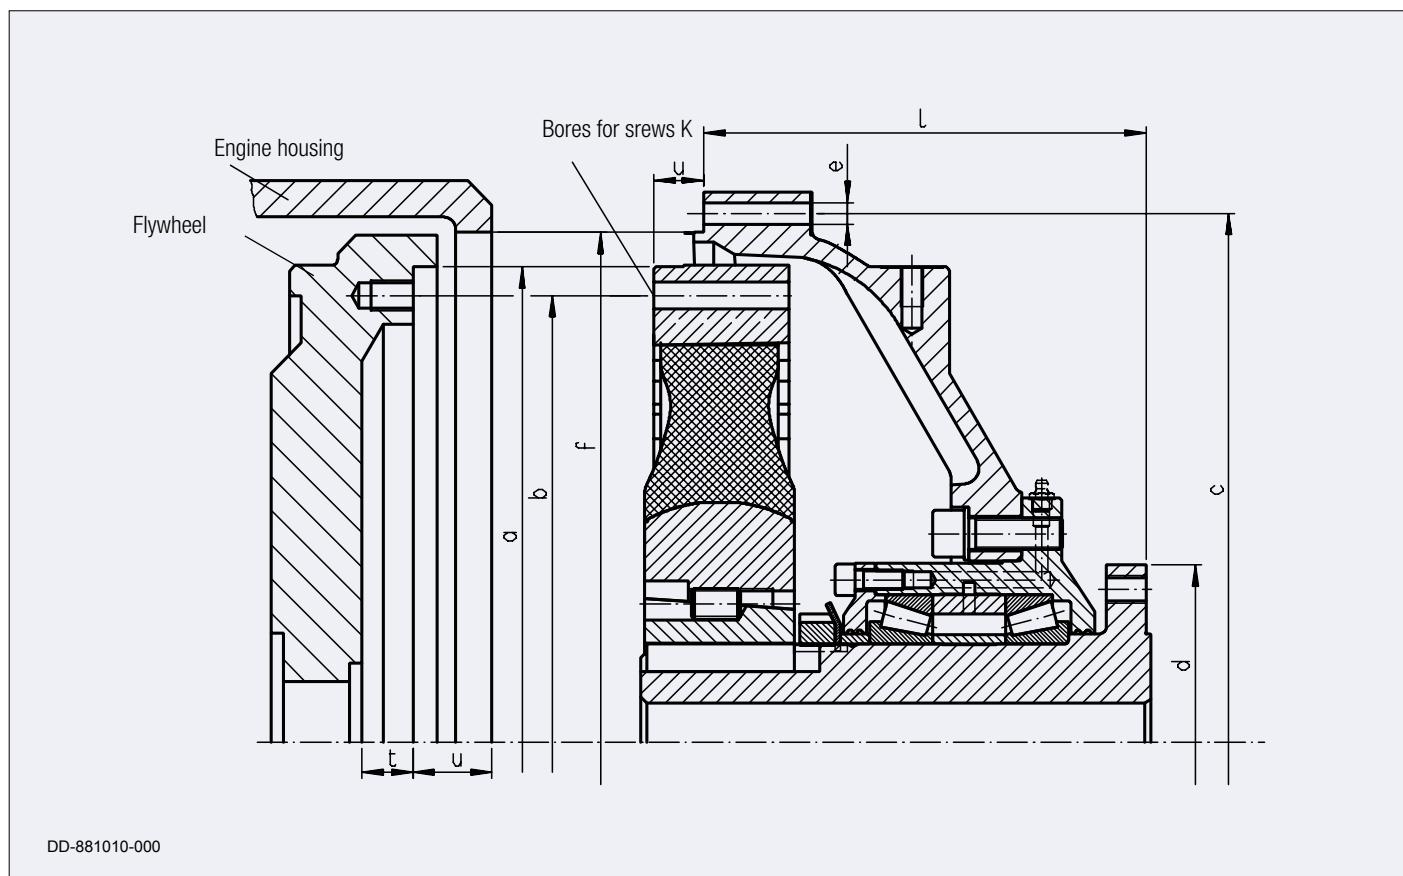

4) Material-related tolerances as high as  $\pm 15\%$  are possible.

5) The  $P_{KV60}$  value describes the damping performance that can be absorbed over 60 minutes.

The damping power that can be absorbed permanently is  $P_{KV\infty} = 0,5 \cdot P_{KV60}$ .

# Highly Flexible Couplings for Cardan Shafts

## Stromag IGE...FG Series

### Stromag IGE...FG Concept

The Stromag IGE...FG is a highly flexible rubber coupling with a progressive characteristic (see figure). It is ideal for the transmission of high torques with its particularly compact design and light weight.

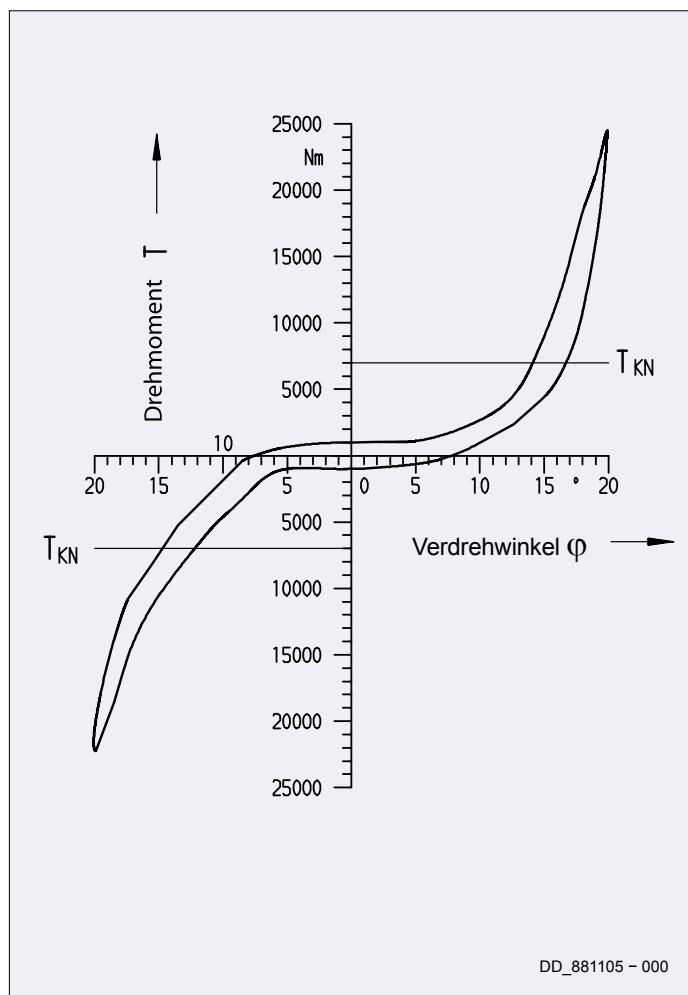

The coupling's outer part can be connected directly to a diesel engine's flywheel or similar. The torque is transmitted to the hub and the cardan shaft via rubber elements arranged in a star pattern. The inner part of the coupling, consisting of the hub and support flange, is radially supported in the outer part of the coupling via the shaft and bushing and fixed in the axial direction using rings.

The radial and axial forces generated by the cardan shaft are absorbed by the coupling and transmitted to the main engine bearing.

The series extends across a nominal torque range from 4000 Nm to 25,000 Nm.

The Stromag IGE...FG is manufactured exclusively from metal or high-quality cast parts. They are manufactured from turned parts to ensure that they run smoothly and quietly.

The Stromag IGE...FG coupling is ideal for absorbing large impact torques due to the use of rubber elements with embedded extremely strong fabric. Large alternating torques are also permitted, as the damping heat is easily dissipated via the space between the individual elements.

## Stromag IGE...FG output table

IGE-Coupling size	Nominal torque	Maximum torque	Adm. alternating torque					Dyn. Torsional stiffness					Adm. Speed	Relative damping	Adm. damping power	
			T <sub>wzul</sub> (at...% preload) [kNm/rad]					C <sub>T<sub>dyn</sub></sub> (at...% preload) [kNm/rad] 1) 2)								
	T <sub>KN</sub> Nm	T <sub>Kmax</sub> Nm	10 %	25 %	50 %	75 %	100 %	10 %	25 %	50 %	75 %	100 %				
4	4000	12000	0.20	0.80	1.30	1.69	2.08	14.0	31.6	60.9	90.2	120	3900	1.0	940

# Highly Flexible Couplings for Cardan Shafts

## Characteristics for cardan shaft couplings

### $T_{KN}$

The coupling's nominal torque can be continuously transmitted over the whole permitted speed range. It must not be exceeded by the system's nominal torque  $T_N$ .

$$T_{KN} \geq T_N$$

### $T_{Kmax1}$

The coupling's maximum torque  $T_{Kmax1}$  can be endured as a peak load and may not be exceeded by normal, non-stationary system peak torques  $T_{max1}$ .

A system's normal non-stationary modes are unavoidable and occur repeatedly (e.g.: starting/stopping processes, resonance pass, switching processes, acceleration processes, etc.).

$$T_{Kmax1} \geq T_{max1}$$

### $T_{Kmax2}$

The coupling's maximum torque  $T_{Kmax2}$  can be endured as a rarely occurring peak load and may not be exceeded by normal, non-stationary system peak torques  $T_{max2}$ .

Anomalous, non-stationary system peak torques are avoidable and are not part of the planned operating scheme (e.g.: emergency stop, sync failure, short circuit, etc.).

A coupling overload due to anomalous, non-stationary system peak torques  $T_{max2}$  shortens the system's service life and is tolerated in individual cases.

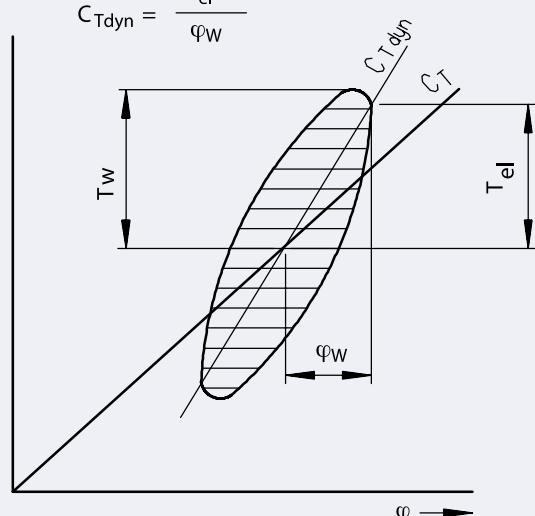

$$T_{Kmax2} \geq T_{max2}$$

### $T_{kw}$

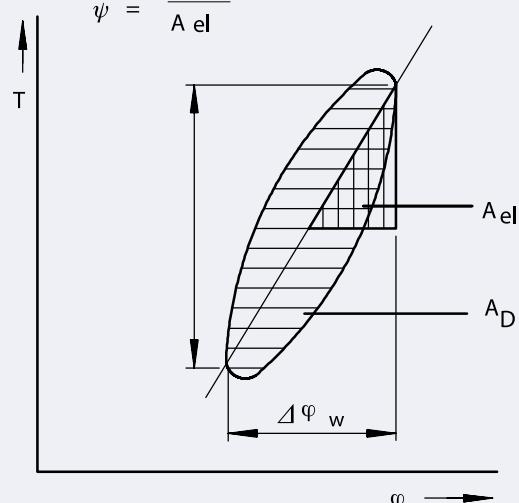

The admissible permanent alternating torque indicates the amplitude of the admissible permanent periodic torque fluctuation. This torque may be superimposed on a base load of  $T_{KN}$ .

In this process, the max damping power  $P_{kv}$  must also be checked.

$$C_{Tdyn} = \frac{T_{el}}{\varphi_w}$$

$$\psi = \frac{A_D}{A_{el}}$$

DD 8700103 - 000

# Highly Flexible Couplings for Cardan Shafts

## Characteristics for cardan shaft couplings

### **C<sub>T<sub>dyn</sub></sub>**

The dynamic torsional stiffness indicates the ratio of torque amplitude to torsion angle amplitude during an oscillation.

The torque amplitude is superimposed on an initial load (coupling torque).

For couplings with a linear characteristic (Stromag Periflex® CS and AFL), the C<sub>T<sub>dyn</sub></sub> value over the coupling torque is constant. However, it changes depending on the amplitude, the frequency and the temperature of the flexible element.

C<sub>T<sub>dyn</sub></sub> data relate to a coupling torque of 0,8 • T<sub>KN</sub>, an alternating torque of 0,2 • T<sub>KN</sub> and a frequency of 10 Hz for a coupling at operating temperature with a surface temperature of about 30°C.

Stromag IGE coupling has a progressive characteristic. i.e. the C<sub>T<sub>dyn</sub></sub> value also changes depending on the coupling torque.

$$C_{T_{dyn}} = \frac{T_{el}}{\varphi_w}$$

### **Ψ**

The relative damping is a measure of the ability of the coupling to convert part of the vibration energy into heat.

The damping can be determined using the damping loop (hysteresis loop).

A<sub>el</sub> surface represents the flexible strain energy W<sub>el</sub> during a load.

The A<sub>D</sub> surface is a measure for the damping work W<sub>D</sub> during a vibration cycle.

The Ψ data relate to a coupling torque of 0.8 • T<sub>KN</sub>, an alternating torque of 0.2 • T<sub>KN</sub> and a frequency of 10 Hz for a coupling at operating temperature with a surface temperature of about 30°C.

$$\Psi = \frac{W_D}{W_{el}} = \frac{A_D}{A_{el}}$$

### **P<sub>kv</sub>**

The permitted damping power indicates how much damping (heat) the coupling can permanently absorb and dissipate. The sum of the damping performance from every vibration order (i.e. P<sub>vi</sub>) must be less than the coupling's damping performance.

$$P_{vi} = \frac{\pi}{\sqrt{\left(\frac{2\pi}{\Psi}\right)^2 + 1}} \cdot \frac{T_{wi}^2 \cdot f_i}{C_{T_{dyn}}}$$

$$P_{kv} \geq \sum P_{vi}$$

P<sub>KV60</sub> value describes the damping performance that can be absorbed over an hour.

P<sub>KV60</sub> value needs to be multiplied by a factor of 0.5 to determine the damping performance that can be permanently absorbed (P<sub>KV∞</sub>).

**ALTRA INDUSTRIAL MOTION**

[WWW.ALTRAMOTION.COM](http://WWW.ALTRAMOTION.COM)

Our comprehensive product offerings include various types of clutches and brakes, overrunning clutches, engineered bearing assemblies, gearing and gear motors along with linear products, belted drives, couplings and geared cam limit switches. With thousands of product solutions available, Altra provides true single source convenience while meeting specific customer requirements. Many major OEMs and end users prefer Altra products as their No. 1 choice for performance and reliability.
